Introduction To Template Metaprogramming

TMP considered sexy

Metaprogramming

- ▶ “programming programs”

Metaprogramming

- ▶ “programming programs”
- ▶ write code in a *metalanguage* to modify code in an *object language*

Metaprogramming

- ▶ “programming programs”
- ▶ write code in a *metalanguage* to modify code in an *object language*
- ▶ in TMP C++ is both meta and object language

Metaprogramming - Examples

- ▶ C preprocessor

Metaprogramming - Examples

- ▶ C preprocessor
- ▶ parser generators

Metaprogramming - Examples

- ▶ C preprocessor
- ▶ parser generators
- ▶ manipulating a running program using reflection APIs

Metaprogramming - Examples

- ▶ C preprocessor
- ▶ parser generators
- ▶ manipulating a running program using reflection APIs
- ▶ Macros in Lisp

Metaprogramming - C Preprocessor

```
1  int main() {
2      int seconds = 3;
3
4  #ifdef DEBUG
5      std::cout << " Sleeping for " << seconds
6              << " seconds" << std::endl;
7  #endif
8
9  #if defined(_WIN32)
10     Sleep(seconds * 1000);
11 #elif defined(__unix__)
12     sleep(seconds);
13 #else
14 #    error "unknown operating system"
15 #endif
16 }
```

Templates

Introduction To Template Metaprogramming

TMP considered sexy

Templates - Template Function `max`

```
10 int main() {  
11     std::cout << max(23, 42) << std::endl  
12         << max('c', '+') << std::endl;  
13 }
```

Templates - Template Function `max`

```
1  template <typename T>
2      T max(T a, T b)
3  {
4      return (a > b)
5          ? a : b;
6  }
7
8
9
10 int main() {
11     std::cout << max(23, 42) << std::endl
12             << max('c', '+') << std::endl;
13 }
```

Templates - Template Function `max`

```
1  template <typename T>    int max(int a, int b) {
2      T max(T a, T b)      return (a > b)
3  {                          ? a : b;
4      return (a > b)        }
5      ? a : b;
6  }
7
8
9      char max(char a, char b) {
10     return (a > b)
11     ? a : b;
12 }
13
14 int main() {
15     std::cout << max(23, 42) << std::endl
16     << max('c', '+') << std::endl;
17 }
```

Templates - Overview

- ▶ classes and functions can have template parameters

Templates - Overview

- ▶ classes and functions can have template parameters
- ▶ template parameters can be types or constants

Templates - Overview

- ▶ classes and functions can have template parameters
- ▶ template parameters can be types or constants
- ▶ a template by itself yields no code
- ▶ code is generated when template is *instantiated* with parameters

Templates - Overview

- ▶ classes and functions can have template parameters
- ▶ template parameters can be types or constants
- ▶ a template by itself yields no code
- ▶ code is generated when template is *instantiated* with parameters
- ▶ template instantiation is done at compile time

Templates - Template Class Array

```
1  template <typename T>
2      class Array
3  {
4      public :
5          typedef T value_type;
6
7          void set(size_t pos, const value_type &obj) {
8              data_[pos] = obj;
9          }
10
11         const value_type &get(size_t pos) const {
12             return data_[pos];
13         }
14
15     private :
16         value_type *data_;
17 };
```

Templates - Concepts

```
1  class Foo {
2  public:
3      void func();
4  };
5
6  class Bar {
7  public:
8      void other_func();
9  };
10
11 template <typename T>
12     void temp_func(T obj)
13 {
14     obj.func();
15 }
```

Templates - Concepts

- ▶ Every template has **implicit** requirements for the given types

Templates - Concepts

- ▶ Every template has **implicit** requirements for the given types
 - ▶ function members
 - ▶ data members
 - ▶ operators
 - ▶ typedefs
 - ▶ ...

Templates - Concepts

- ▶ Every template has **implicit** requirements for the given types
 - ▶ function members
 - ▶ data members
 - ▶ operators
 - ▶ typedefs
 - ▶ ...
- ▶ Failing these requirements produces ugly compiler errors

Templates - Concepts

- ▶ Every template has **implicit** requirements for the given types
 - ▶ function members
 - ▶ data members
 - ▶ operators
 - ▶ typedefs
 - ▶ ...
- ▶ Failing these requirements produces ugly compiler errors
- ▶ Concepts document and enforce these requirements

Templates - Concepts

- ▶ Every template has **implicit** requirements for the given types
 - ▶ function members
 - ▶ data members
 - ▶ operators
 - ▶ typedefs
 - ▶ ...
- ▶ Failing these requirements produces ugly compiler errors
- ▶ Concepts document and enforce these requirements
- ▶ Not (yet) part of C++
- ▶ anyway good tool to document and communicate the requirements

Introduction To Template Metaprogramming

TMP considered sexy

TMP Example: Factorial

```
1 template <int N>
2     struct Factorial
3 {
4     static const int value =
5         N * Factorial<N-1>::value;
6 };
```

TMP Example: Factorial

```
1  template <int N>
2      struct Factorial
3  {
4      static const int value =
5          N * Factorial<N-1>::value;
6  };

7  template <>
8      struct Factorial<0>
9  {
10     static const int value = 1;
11 };
```

TMP Example: Factorial

```
1  template <int N>
2      struct Factorial
3  {
4      static const int value =
5          N * Factorial<N-1>::value;
6  };

7  template <>
8      struct Factorial<0>
9  {
10     static const int value = 1;
11 };

12 const int some_constant = Factorial<7>::value;
```

TMP Overview

- ▶ Programming with Templates

TMP Overview

- ▶ Programming with Templates
- ▶ Not designed for general purpose programming
- ▶ Discovered to be turing complete after standardization

TMP Overview

- ▶ Programming with Templates
- ▶ Not designed for general purpose programming
- ▶ Discovered to be turing complete after standardization
- ▶ no variables
- ▶ pure functional language

TMP Overview

- ▶ Programming with Templates
 - ▶ Not designed for general purpose programming
 - ▶ Discovered to be turing complete after standardization
 - ▶ no variables
 - ▶ pure functional language
 - ▶ many language constructs similar to Haskell
- ⇒ used as pseudocode language

TMP Overview

- ▶ Programming with Templates
 - ▶ Not designed for general purpose programming
 - ▶ Discovered to be turing complete after standardization
 - ▶ no variables
 - ▶ pure functional language
 - ▶ many language constructs similar to Haskell
- ⇒ used as pseudocode language
- ▶ Boost.Mpl

Units: Interface

- ▶ Express units by types

Units: Interface

- ▶ Express units by types
- ▶ use **int** template parameters to express exponentiation of base units

Units: Interface

- ▶ Express units by types
- ▶ use **int** template parameters to express exponentiation of base units

```
1 Length l = 25.35 * metre;  
2 Mass m   = 19 * kilogramm;  
3 Time t1  = 12 * second;  
4 Time t2  = 19 * second;  
5  
6 Force f  = l * m / (t1 * t2);
```

Units: Interface

- ▶ Express units by types
- ▶ use **int** template parameters to express exponentiation of base units

```
1 Length l = 25.35 * metre;  
2 Mass m   = 19 * kilogramm;  
3 Time t1  = 12 * second;  
4 Time t2  = 19 * second;  
5  
6 Force f  = l * m / (t1 * t2);
```

```
1 Length l = 17.49 * second;
```

Units: Interface

- ▶ Express units by types
- ▶ use **int** template parameters to express exponentiation of base units

```
1 Length l = 25.35 * metre;  
2 Mass m   = 19 * kilogramm;  
3 Time t1  = 12 * second;  
4 Time t2  = 19 * second;  
5  
6 Force f  = l * m / (t1 * t2);
```

```
1 Length l = 17.49 * second; ERROR!
```

Units: Code - class Unit

```
1  template <int M, int KG, int S>
2      class Unit
3  {
4  public:
5      Unit(double value)
6      : value_(value) {}
7
8      double value() const {
9          return value_;
10     }
11
12 private:
13     double value_;
14 };
```

Units: Code - Operators (1/3)

```
1 template <int M, int KG, int S>
2     Unit<M, KG, S>
3     operator*(double lhs , Unit<M, KG, S> rhs)
4 {
5     return lhs * rhs.value();
6 }
7
8 template <int M, int KG, int S>
9     Unit<M, KG, S>
10    operator*(Unit<M, KG, S> lhs , double rhs)
11 {
12    return lhs.value() * rhs;
13 }
```

Units: Code - Operators (2/3)

```
1  template <
2      int M1, int KG1, int S1,
3      int M2, int KG2, int S2
4  >
5      Unit<
6          M1 + M2,
7          KG1 + KG2,
8          S1 + S2
9  >
10     operator*(
11         Unit<M1, KG1, S1> lhs,
12         Unit<M2, KG2, S2> rhs
13     )
14 {
15     return lhs.value() * rhs.value();
16 }
```

Units: Code - Operators (3/3)

```
1  template <
2      int M1, int KG1, int S1,
3      int M2, int KG2, int S2
4  >
5      Unit<
6          M1 - M2,
7          KG1 - KG2,
8          S1 - S2
9  >
10     operator / (
11         Unit<M1, KG1, S1> lhs,
12         Unit<M2, KG2, S2> rhs
13     )
14 {
15     return lhs.value() / rhs.value();
16 }
```

Units: Code - typedefs and Objects

```
1 typedef Unit<1, 0, 0> Length;  
2 typedef Unit<0, 1, 0> Mass;  
3 typedef Unit<0, 0, 1> Time;  
4  
5 typedef Unit<1, 1, -2> Force;  
6  
7 Length metre(1.0);  
8 Mass kilogramm(1.0);  
9 Time second(1.0);  
10  
11 Force newton(1.0);
```

Units - Conclusion

- ▶ Only proof of concept code
- ▶ Lots of work remains to be done

Units - Conclusion

- ▶ Only proof of concept code
- ▶ Lots of work remains to be done
- ▶ If you want to use this code \Rightarrow Boost.Unit

- ▶ Domain Specific Embedded Language

DSEL

- ▶ Domain Specific Embedded Language
- ▶ DSL: A language specially designed for a specific purpose

DSEL

- ▶ Domain Specific Embedded Language
- ▶ DSL: A language specially designed for a specific purpose
- ▶ DSEL: A DSL embedded into C++

DSEL

- ▶ Domain Specific Embedded Language
- ▶ DSL: A language specially designed for a specific purpose
- ▶ DSEL: A DSL embedded into C++
- ▶ Implemented using operator overloading and TMP

DSEL

- ▶ Implemented using operator overloading and TMP
- ▶ Boost.Proto

Boost.Spirit

- ▶ Parser generator for context free grammars

Boost.Spirit

- ▶ Parser generator for context free grammars
- ▶ DSL: EBNF
- ▶ DSEL: as close to EBNF as possible

Boost.Spirit

- ▶ Parser generator for context free grammars
- ▶ DSL: EBNF
- ▶ DSEL: as close to EBNF as possible
- ▶ Because of missing operators/operator precedence: Little differences

Boost.Spirit: Sample

▶ EBNF

```
1 start      = expression | addition ;
2 expression = "(" , addition , ")" | number ;
3 addition   = expression , "+", expression ;
4 (* number is omitted here *)
```

Boost.Spirit: Sample

▶ EBNF

```
1 start      = expression | addition ;
2 expression = "(" , addition , ")" | number ;
3 addition   = expression , "+", expression ;
4 (* number is omitted here *)
```

▶ Boost.Spirit

```
1 start      = expression | addition ;
2 expression = '(' >> addition >> ')' | int_ ;
3 addition   = expression >> '+' >> expression ;
4 // int_ is provided by Spirit
```

Boost.Spirit

- ▶ Based on PEG

Boost.Spirit

- ▶ Based on PEG
- ▶ Can generate parsers, writers and lexers

Boost.Spirit

- ▶ Based on PEG
- ▶ Can generate parsers, writers and lexers
- ▶ Many possibilities to access the parsed data

Boost.Spirit

- ▶ Based on PEG
- ▶ Can generate parsers, writers and lexers
- ▶ Many possibilities to access the parsed data
 - ▶ semantic actions

Boost.Spirit

- ▶ Based on PEG
- ▶ Can generate parsers, writers and lexers
- ▶ Many possibilities to access the parsed data
 - ▶ semantic actions
 - ▶ attributes

Boost.Spirit

- ▶ Based on PEG
- ▶ Can generate parsers, writers and lexers
- ▶ Many possibilities to access the parsed data
 - ▶ semantic actions
 - ▶ attributes
 - ▶ parse tree (utree)

Boost.Parameter

- ▶ C++ has no named function arguments

Boost.Parameter

- ▶ C++ has no named function arguments
- ▶ calling functions with many parameters can be annoying and error prone

Boost.Parameter

- ▶ C++ has no named function arguments
- ▶ calling functions with many parameters can be annoying and error prone

⇒ Building named function arguments as a library:

```
1 print_text(  
2     "the text",  
3     font_size=12,  
4     bold=true ,  
5     italic=false ,  
6     color=green  
7 );
```

Expression Templates

- ▶ $a + b + c$ yields code like `add(add(a, b), c)`

Expression Templates

- ▶ $a + b + c$ yields code like `add(add(a, b), c)`
- ⇒ `add(a, b)` returns a temporary object which is only used to add `c`

Expression Templates

- ▶ $a + b + c$ yields code like `add(add(a, b), c)`
- ⇒ `add(a, b)` returns a temporary object which is only used to add `c`
- ▶ if you add large matrices this can become a performance problem

Expression Templates

- ▶ $a + b + c$ yields code like `add(add(a, b), c)`
- ⇒ `add(a, b)` returns a temporary object which is only used to add `c`
- ▶ if you add large matrices this can become a performance problem
- ▶ use `TMP` to evaluate the whole expression when the result is required

Expression Templates

- ▶ $a + b + c$ yields code like `add(add(a, b), c)`
- ⇒ `add(a, b)` returns a temporary object which is only used to add `c`
- ▶ if you add large matrices this can become a performance problem
- ▶ use `TMP` to evaluate the whole expression when the result is required
- ▶ enables generation of highly optimised code while enabling the programmer to use a natural syntax
- ▶ performs similar to Fortran
